

How YEC Data Transfer Rate Test Works!?

When you select Duplication in “Special Mode”, The following TEST will be performed before duplication (approximately 2min.)

1. Prior to HDD Duplication all target HDD will be sampled to set the benchmark transfer speed* in (MB/s). * Select the fastest HDD as the benchmark transfer rate.

Sampling

2. In this example, when Parameter is set at “2” (default), threshold become (30, 25, 20) MB/s.
3. YEC equipments perform the test before duplication, so no waste time for bad hard drive duplication.

Actual Measurement (All HDD tested!)
